What is an Examination Under Anaesthetic (EUA) (Rectum)?

EUA is an investigation carried out under a general anaesthetic (whilst you are asleep) to obtain more information about your symptoms. This will involve looking in the anus (back passage) and bowel. A small telescope may be inserted into your rectum that helps the surgeon identify anything unusual. In addition small pieces of tissue may be removed and sent to the laboratory to be examined under the microscope.

Why do I need an EUA?

Usually it is to investigate the cause of your symptoms, for example:

- Pain in and around the anus caused by spasm.
- Difficulty opening your bowels.
- Bleeding when opening your bowels.
- Itching in and around the anus (bottom).

Are there any risks involved?

Complications are unusual, but are rapidly recognised and dealt with by the nursing and medical staff. Such as:

- Perforation (puncture) of the bowel.
- Recurrent pain or spasm.
- Chest infection especially if you smoke.
- Bleeding/infection/inflammation.

What should I expect after the examination?

- You should expect to feel sore for a day or so. Once the anaesthetic starts to wear off, simple painkillers that you normally take at home should alleviate any pain or discomfort. It is advisable to avoid codeine as this can cause constipation.
- You may experience some bleeding which usually settles by itself.

How long will it take me to recover?

- You are likely to feel tired and need to rest for the first day or two.
- We advise you to have a high fibre diet and drink plenty of water, this will help your bowels.
- **Do not** rub, scratch, or use creams (unless they have been prescribed by your doctor or consultant) on or around the anus.
- Wash and clean around the anus each morning and night, also after every bowel movement.

You may need to see your GP/walk in centre if:

- You have experience any abdominal pain.
- Have increasing pain, redness, swelling or discharge.
- Have severe bleeding or constipation for more than three days, despite using a laxative.
- Have difficulty in passing urine, high temperature (over 38°C), chills or persistent nausea or vomiting.
